

LIFTSAFE FALL PROTECTION

Liftsafe Fall Protection helps eliminate workplace fall accident risks by providing rooftop, ground support, netting, and engineered fall protection systems to safety-conscious business owners and stakeholders wanting to “engineer out” potential hazards.

Every year, fall-related workplace accidents are among the top three leading causes of injuries and fatalities on the job. Every day, workers are at risk without adequate equipment, training, and prevention systems in place.

That is why Liftsafe Fall Protection offers a complete line of non-penetrating, counter-weighted guardrail protection systems to eliminate potential rooftop falls. Each system is engineered with a simple, modular design to facilitate quick and easy installations without the need for welding, drilling, or bolting into the actual roof structure. This ensures that unexpected leaks do not occur as a result of installation.

With our all-new, redesigned, lightweight, and stackable baseplate system, each system is stable on most roof surfaces, inexpensive to ship, and fully customizable. Liftsafe Fall Protection systems can be reconfigured during installation to work in almost any situation and allow you to be in full compliance with the fall prevention and protection regulations in your jurisdiction.

At the Liftsafe Group of Companies, our focus is creating turnkey solutions that allow your employees to do their jobs safely, while protecting your company from a compliance and liability standpoint. To do this effectively, we offer services that span the entire lifecycle of your lifting, material handling, ground support and fall protection systems equipment.

We design, we build, we inspect, and we maintain.
